

CLAIMS

1. A skeleton structure member made by disposing a solidified granular bulk material obtained by bonding together and thereby solidifying multiple  
5 granules inside a skeleton member of a transport machine and/or a space bounded by a skeleton member and a panel member peripheral thereto,

characterized in that in the solidified granular bulk material the granules are bonded together by surface fusion and an internal pressure is created by expansion.

10

2. A manufacturing method of a skeleton structure member made by disposing a solidified granular bulk material obtained by bonding together and thereby solidifying multiple granules inside a skeleton member of a transport machine and/or a space bounded by a skeleton member and a panel member peripheral  
15 thereto,

characterized in that it includes a step of placing granules made by wrapping a core substance consisting of a liquid or a solid with a film into the skeleton member and/or space in an un-expanded state and a step of causing the granules  
25 to expand by heating them.
